

Global ionospheric electron density reanalysis based on multi-source data assimilation

Xin'an Yue, Bill Schreiner , Bill Kuo, Doug Hunt
COSMIC Program Office, UCAR

Content

- **Motivation**
- **Model and Data description**
- **Reanalysis results and evaluation**

Motivation:

- Global atmosphere, ocean, and land fields reanalysis (ECMWF, NCAR/NCEP) has shown great impacts in climate monitoring, scientific research, and numerical weather prediction.
- For the ionosphere, the main useful parameter is the electron density. RO data, especially the launching of COSMIC, make global electron density reanalysis possible for the first time.
- UCAR/CDAAC processes many data for multi-missions. Reanalysis can make good use and archive of these data. Will benefit the ionospheric weather, climate, variability study, applications.

✓ **Global ionospheric data assimilation model:**

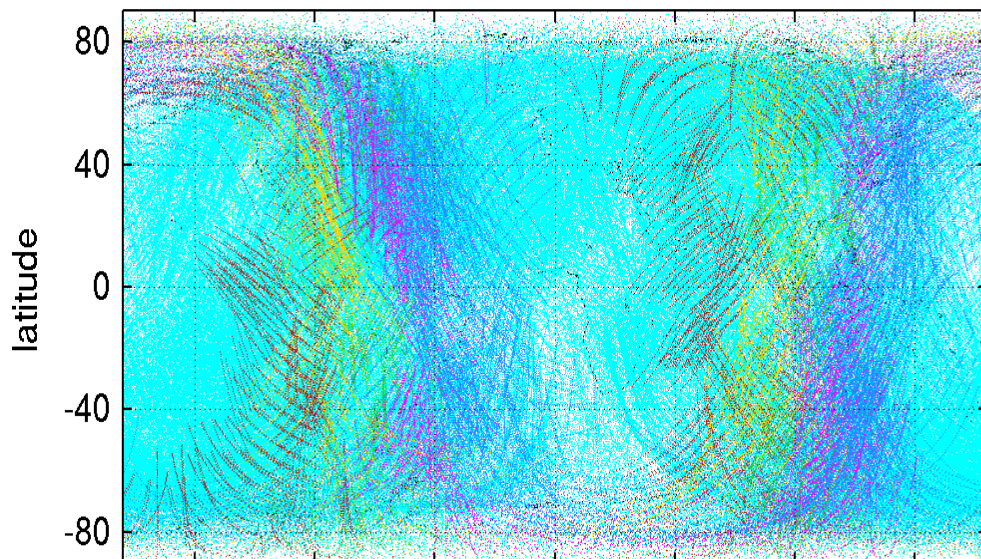

- **Background model:** empirical model (NeQucik, IRI), easy to add other(theoretical) models
- **Space Resolution:** flexible, 2.5 latitude, 5 longitude, 20 km altitude in this study.
- **Background correlation and error:** Gaussian correlation, cutoff when $dlat > 10$, $dlon > 20$, and $dalt > 60$; square of background Ne.
- **Observation correlation and error:** un-correlated; 1% of background error.
- **Time resolution:** flexible, 1 hour in this study.
- **Altitude range:** flexible, 80-2000 km in this study, plasmasphere is calibrated by a simple H^+ model.

✓ Global ionospheric data assimilation model (cont.) :

- **Solve method:** Kalman Filter.
- **Inversion of innovation covariance:** restarted GMRES (generalized minimal residual) iteration method.
- **Input:** GNSS rinex files, IGS GIM, LEO orbit, GNSS orbit, navigation of Glonass (to get the frequency number). flexible to add different kind observations.
- **Data down-sampling and quantity control:** flexible. TEC range restriction; remove duplicate GPS ray.
- **Output:** global 3-D grid electron density.

✓ Data source:

✓ Ground based GNSS process mainly include:

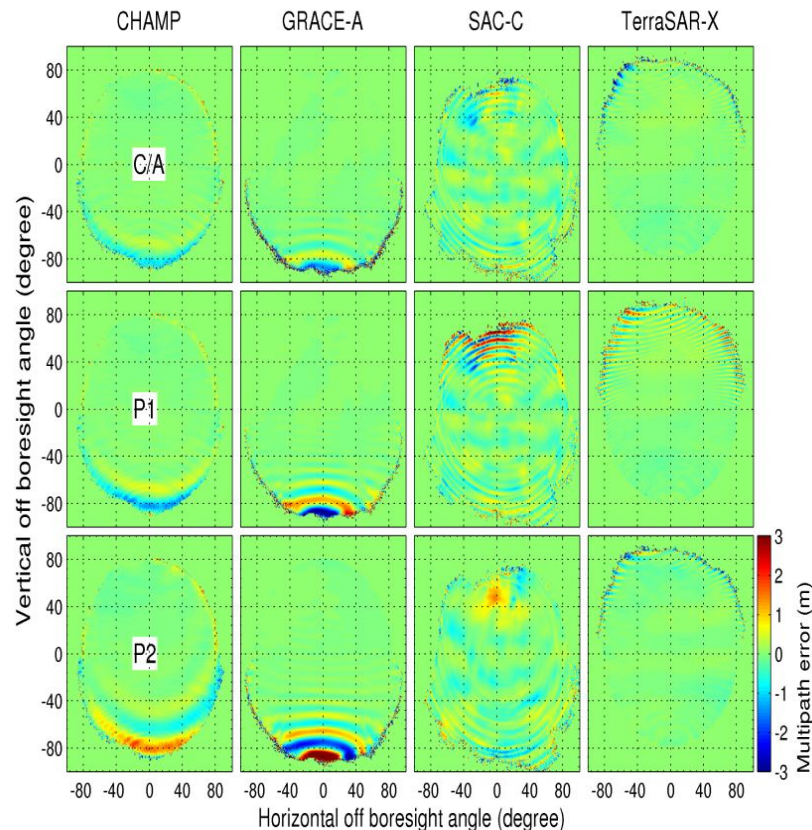

- cycle slip detection;
- Leveling of phase TEC to pseudo-range TEC;
- **Differential Code Bias (DCB) estimation: aided by IGS GIM**

+ Pseudo Range TEC • Levelled TEC

✓ LEO based GNSS process mainly include:

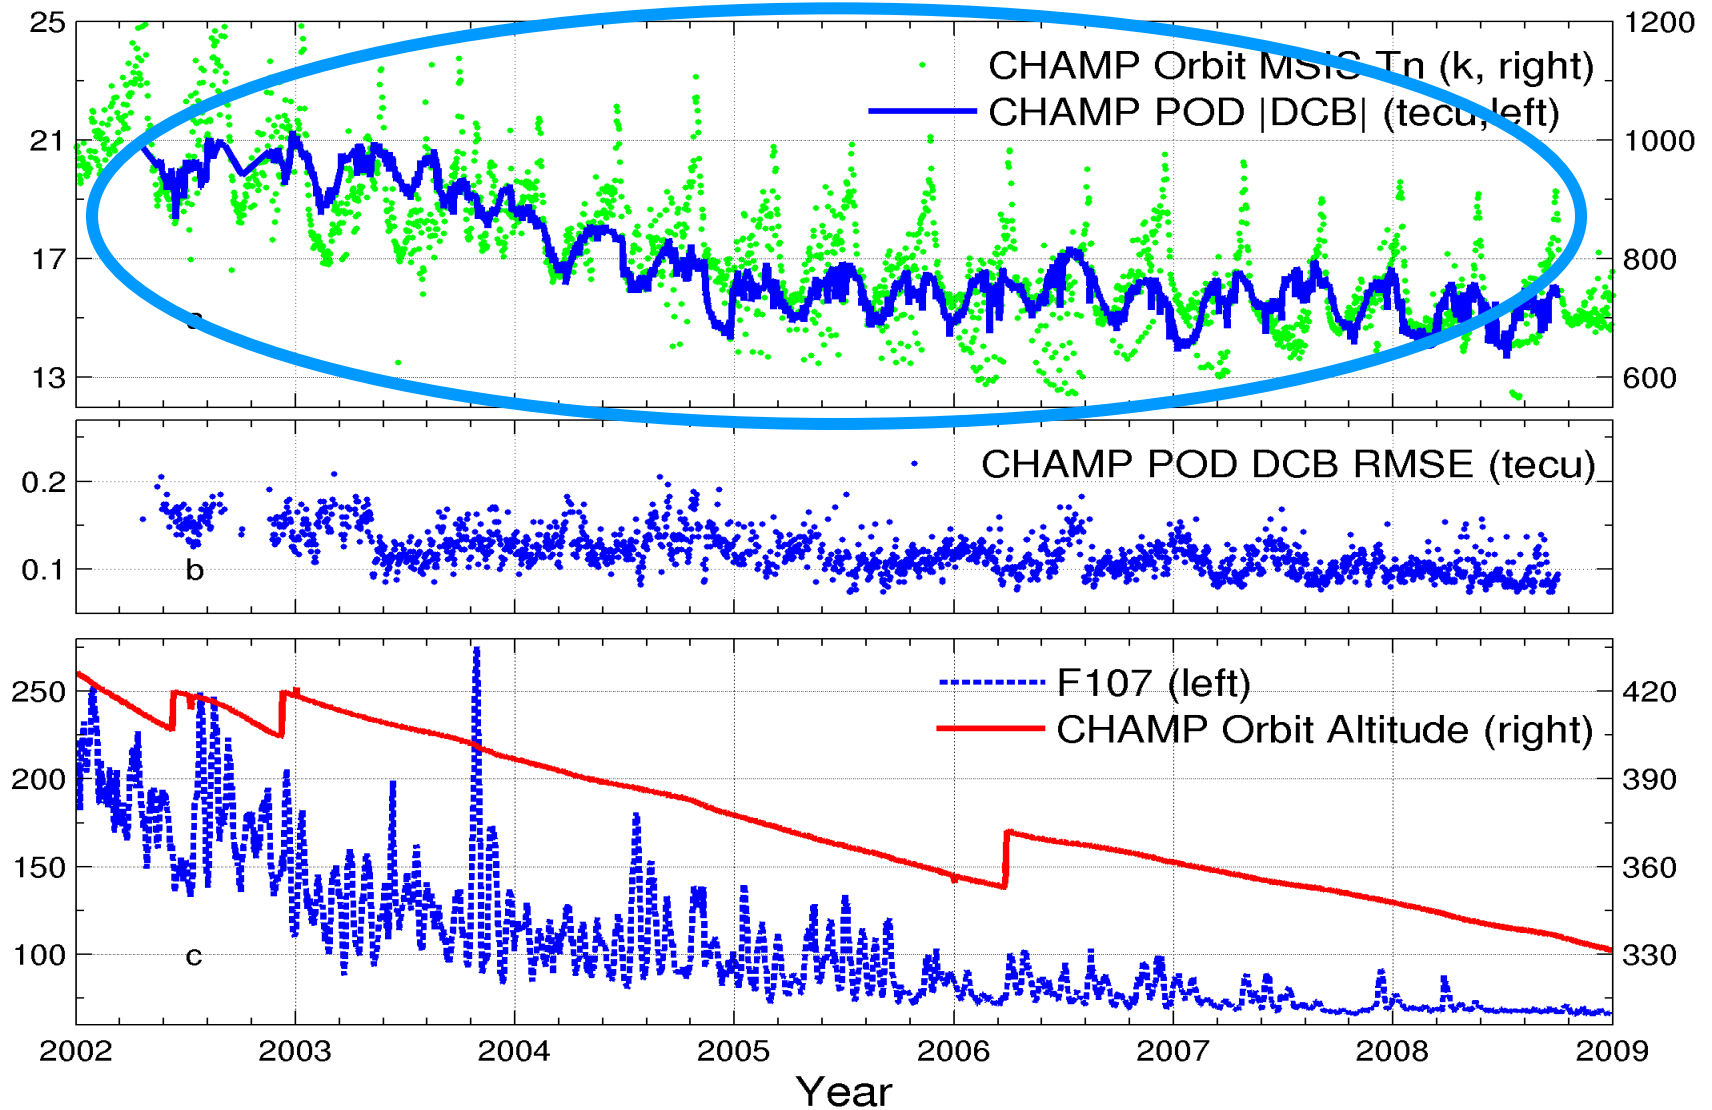

- cycle slip detection;
- **Multi path calibration;**
- Leveling of phase TEC to pseudo-range TEC;
- **Differential Code Bias (DCB) estimation: spherical symmetry assumption**

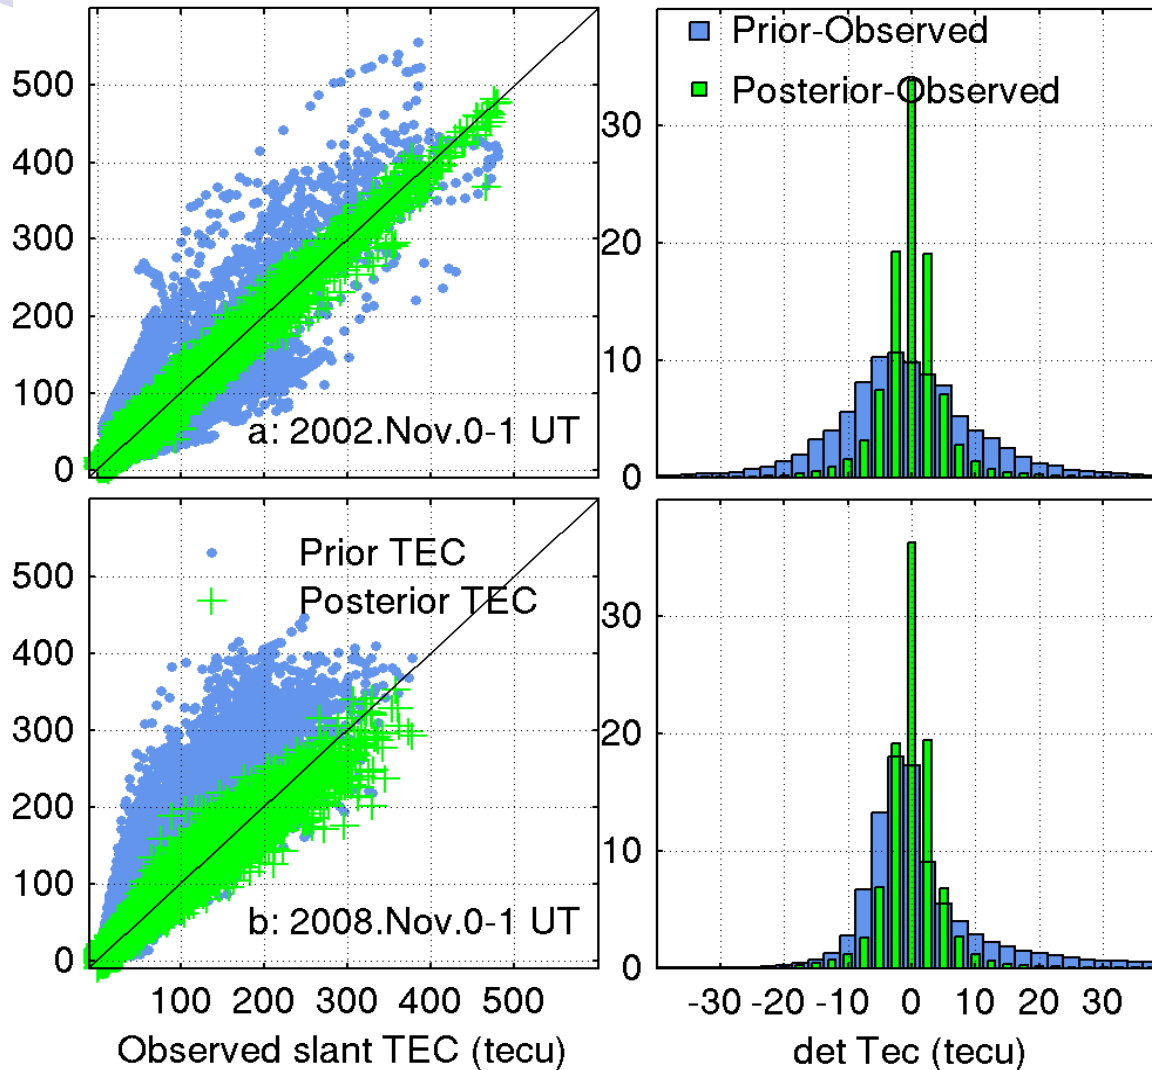

Mission	Inclination (°)/Altitude (km)/mass (kg)	GPS Receiver type	Operation years	POD antenna normal	Multipath RMSE (C/A, m)	Leveling error mean (tecu)	DCB RMSE mean (tecu)
COSMIC FM4	72/700-80 0/70	Blackjack	2006-	75° off the zenith	0.30	0.12	0.69
CHAMP	87.3/460-3 30/522	Blackjack	2000-2009	zenith	0.20	0.19	0.11
GRACE- A	89/~495/4 32	Blackjack	2002-	zenith	0.42	0.31	0.14
SAC-C	98.2/~710/ 467	Blackjack	2000-	zenith	0.42	0.60	0.87
TerraSAR- X	97.44/~51 4/1230	IGOR	2007-	zenith	0.29	0.15	0.09
Metop-A	98.7/~820/ 4093	GRAS	2006-	zenith	0.15	0.09	0.16

Satellite environmental temperature effects on the Differential Code Bias (DCB) estimation: **CHAMP DCB drift agrees well with orbit neutral temperature variation**

✓ Reanalysis results 1: Comparison the slant TEC before and after assimilation

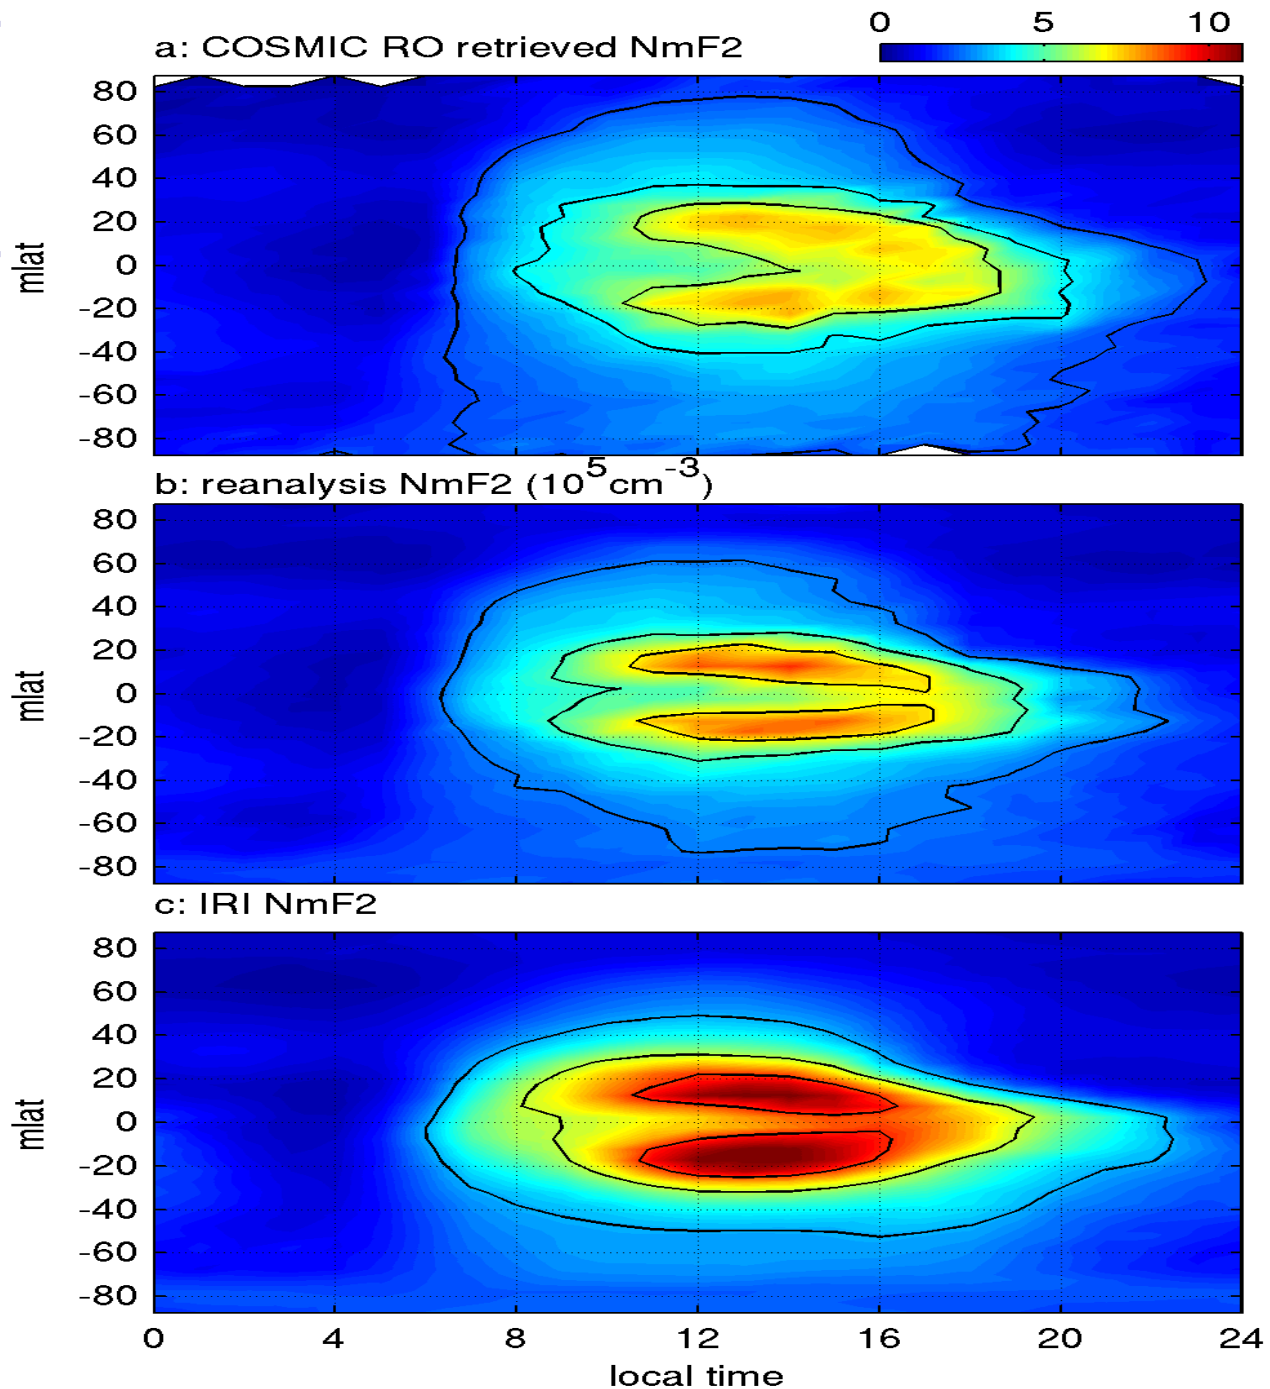

Reanalysis results 2: Global 3-D electron density example

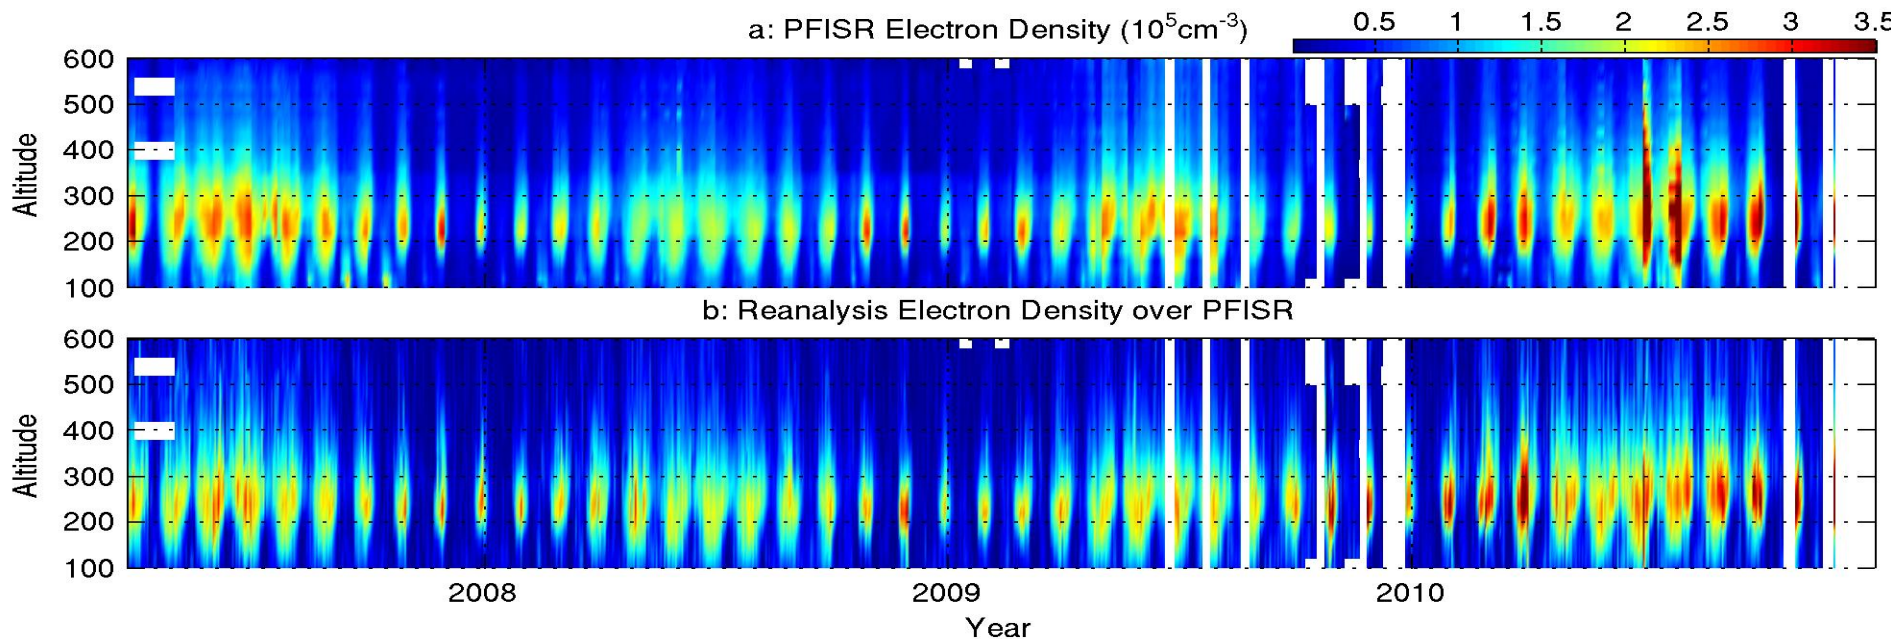

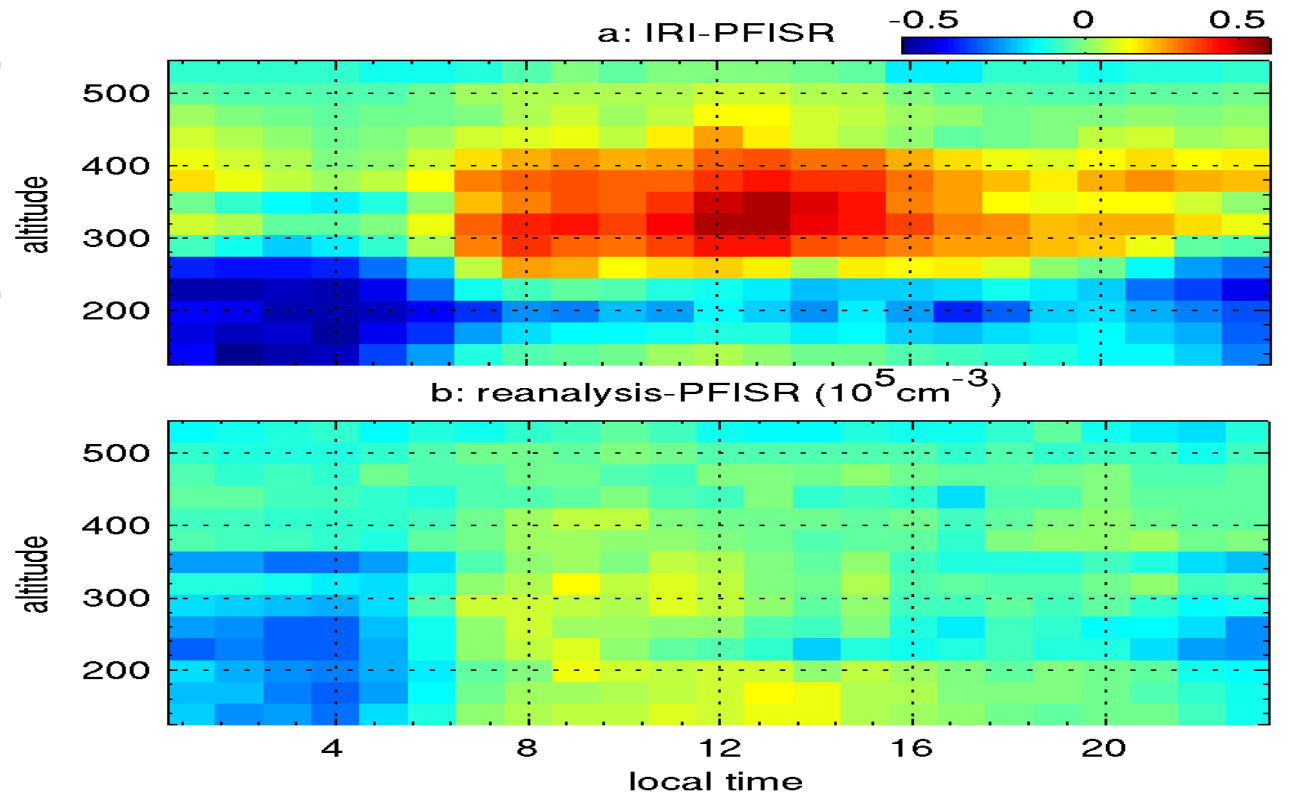

✓ **Reanalysis**
evaluation 1:
Compare
with RO
retrieved
results

✓ Reanalysis evaluation 2: Compare with IGS GEC

✓ Reanalysis
evaluation 3:
Compare with
Poker Flat ISR
(65N, 147W)

✓ Reanalysis evaluation 4: Compare with global

Ionosonde: example (Townsville; 19S, 147E)

a: Townsville (19.63°S, 146.85°E) Ionosonde foF2 (MHz)

b: IRI

c: reanalysis

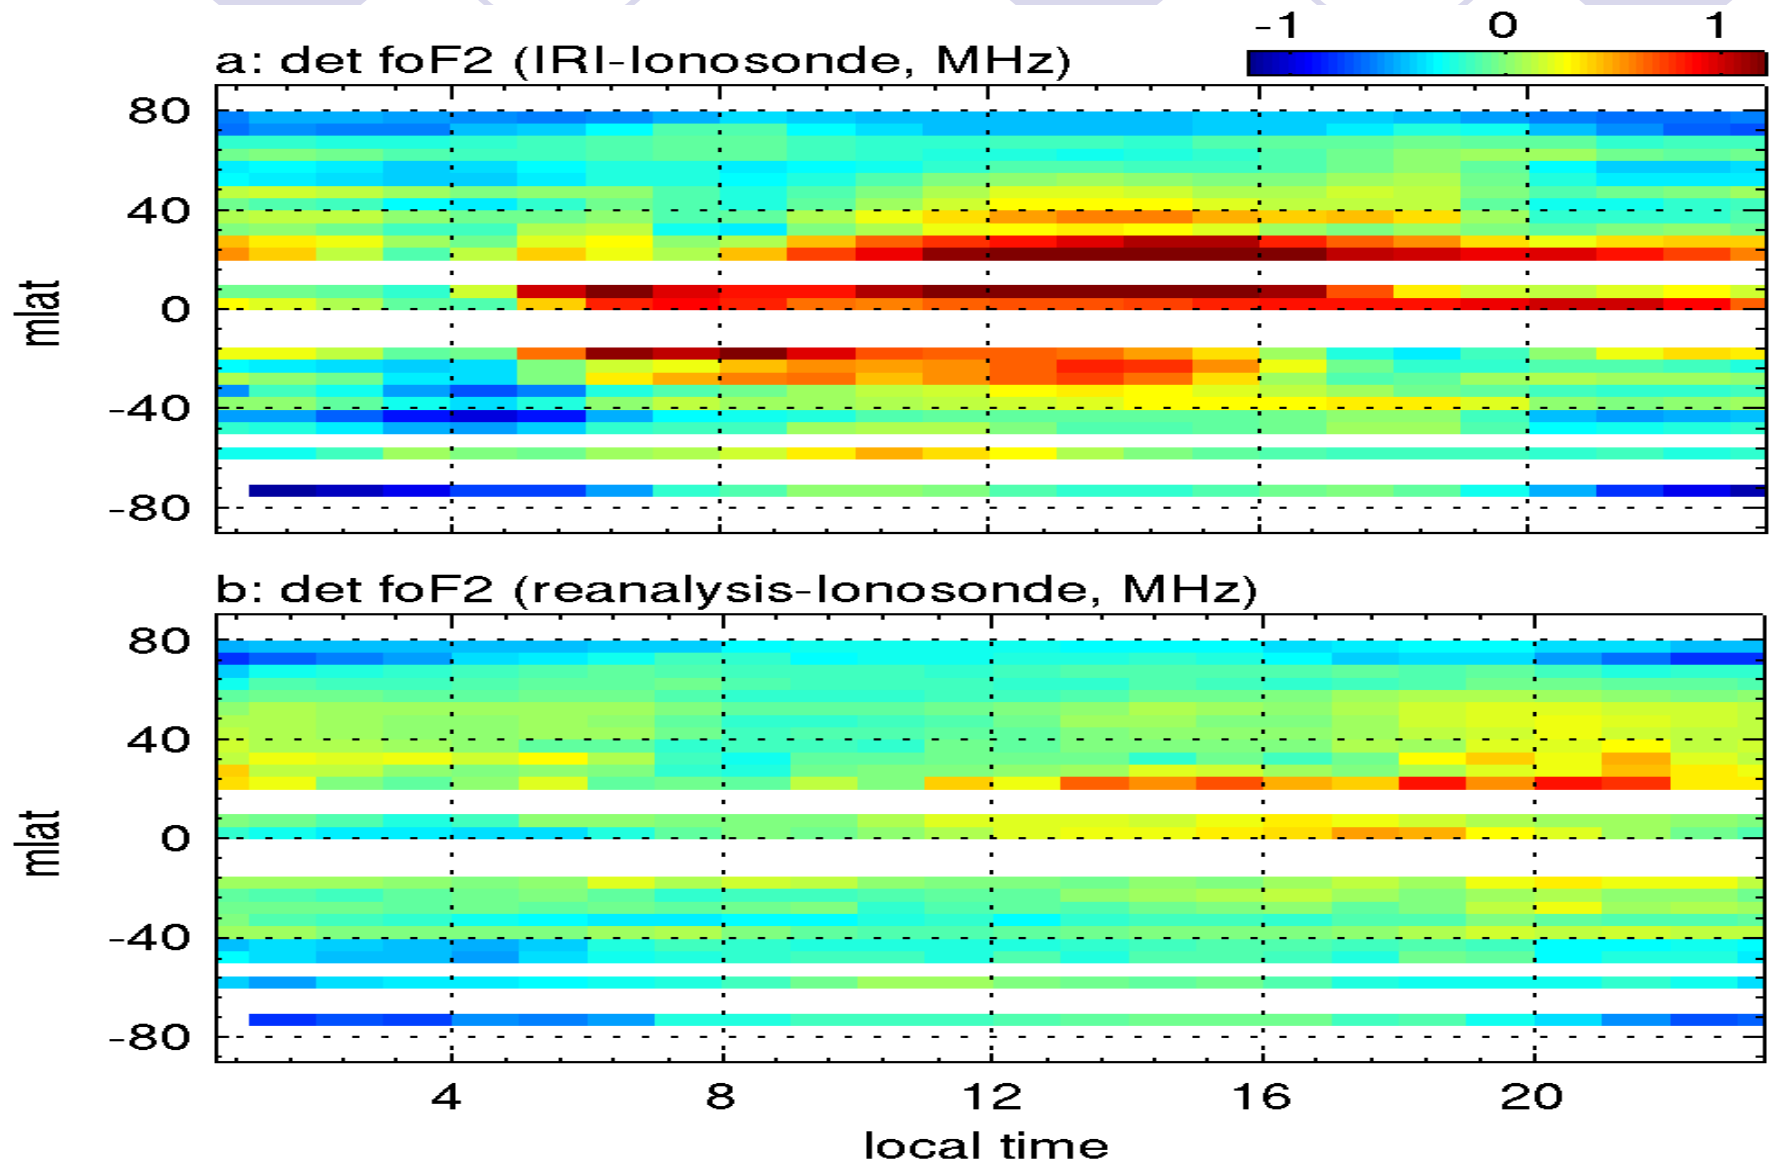

d: IRI-Ionosonde

e: reanalysis-Ionosonde

✓ Reanalysis evaluation 4: Compare with global Ionosonde: Statistical Results

Conclusion:

- ✓ A global ionospheric data assimilation model is constructed.
- ✓ Ionospheric electron density reanalysis during 2002-2011 have been done in UCAR/DAAC.
- ✓ Preliminary evaluations show reasonable results.
